Reflection 3

From this module, what I found interesting is lecture 11, it discussed many programming paradigms, and talked about their differences, and understand different stages of program developments, especially when it mentioned about testing, it reminds what we learn in earlier lecture that Therac-25 killed people because no one was doing the testing. What I surprised about this module is the Scheme language, because I never heard about it before, and Lab 7 gave me some taste about this language, which is fun to have experience with new language. I think Lab 6 is really helping for future job, that we have experience with centralized VCS and decentralized VCS. The last two lectures about JavaScript were kind of help me refresh the knowledge, I learned front-end web development in Udemy, it teaches HTML, JS, and CSS. The most difficult part of the module is terminal. Personally, I don't work with terminal that much, therefore it is hard for me to do Lab 6, even though we worked with terminal in Lab 5, but I was able to use SQL to do the task 1, but while I was doing the Lab, I was reading someone else's work that isn't SQL, I found it is really difficult to do it, and I saw so many command errors in the person's log file. In Lab 6, I had to do many researches, readings and watch videos to help me do the work, from this Lab, I really learned a lot.
